

Karl Roth  
Lab 14  
GEOG479

In this lab we explored the contents of an OpenLayers html file, and learned how to access it through a web browser. The figure below shows the visualization of the file that I put into /var/www/geog479/karoth4/temp.html. You can see in the url that this is the one accessed in my folder. The html file is relatively simple to edit. First define the map (how big), then define base layers (open street map), and finally add other layers like zip codes or rail ways. You can also edit how your mouse clicks interact with the map, and various other web interactions.

## My Map

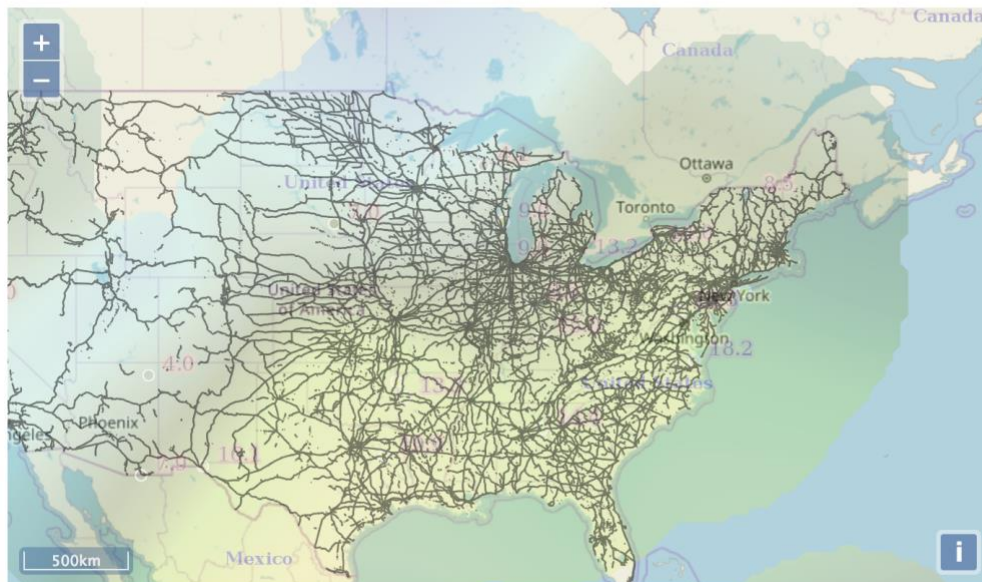

Fig1. The OpenLayers visualization in a web browser.
